

Multiview Geometry

Jayanta Mukhopadhyay
Dept. of Computer Science and Engg.

Multiview Geometry

Given corresponding m images ($\{x_{ij}\}$) for n scene points $\{X_j\}$'s, estimate P_i 's and X_j 's.

Bundle Adjustment

Adjustment of bundle of rays going through each camera center to the set of 3D points.

$$\min_{\{\hat{P}_i\}, \{\hat{X}_j\}} \sum_{i,j} d(\hat{P}_i \hat{X}_j, x_{ij})^2$$

- Tolerant to missing data.
- Requires a good initialization.
- For n points and m views $\rightarrow 3n+11m$ unknowns
- With over-parameterization: $\rightarrow 3n+12m$
- Reduce n and / or m by solving on a subset and merging solutions.
- Interleave of estimates: Alternate minimizing reprojection error by varying P_i 's and X_j 's.

Alternate Minimization

Adjustment of bundle of rays going through each camera center to the set of 3D points.

$$\min_{\{\hat{P}_i\}, \{\hat{X}_j\}} \sum_{i,j} d(\hat{P}_i \hat{X}_j, x_{ij})^2$$

- Form an initial set of scene points $\{X_j\}$, $j=1,2,..n$.
- Given $\{(X_j, x_{kj})\}$, $j=1,2,..n$ for k th camera estimate P_k using DLT or any NL optimization technique.
- Given $\{P_k, k=1,2,..m\}$ estimate $\{X'_j\}$ by forming equations:

$$x_{kj} \times P_k X_j = 0$$
- Solve the above using DLT or other methods.

Methods for initial solution:

- For affine cameras: Factorization
- For projective cameras: Iterative factorization

Affine Reconstruction

$$\min_{\{M_i, t_i\}, \{X_j\}} \sum_{i,j} \|x_{ij} - \widehat{x}_{ij}\|^2 \quad \widehat{x} = \begin{bmatrix} x \\ y \end{bmatrix} = M_{2 \times 3} \begin{bmatrix} X \\ Y \\ Z \end{bmatrix} + t$$

$$\rightarrow \min_{\{M_i, t_i\}, \{X_j\}} \sum_{i,j} \|x_{ij} - (M_i X_j + t_i)\|^2$$

In affine projection,
centroid of points in 3D \rightarrow Centroid of the projections.

Translate every point in every view such that
centroid is $(0,0)^T$ in every view. Centroid in 3D is
 $(0,0,0)^T$ and t_i 's are $(0,0)^T$. $\rightarrow x'_{ij} = x_{ij} - \langle x_{ij} \rangle$

Affine Reconstruction

$$\min_{\{M_i, t_i\}, \{X_j\}} \sum_{i,j} \|x_{ij} - (M_i X_j + t_i)\|^2$$

$$\frac{\partial \sum_{i,j} \|x_{ij} - (M_i X_j + t_i)\|^2}{\partial t_i} = 0 \quad (0,0,0)^T$$

$$t_i = \langle x_{ij} \rangle - M_i \langle X_j \rangle \rightarrow (0,0,0)^T$$

$$= \langle x_{ij} \rangle$$

$$x'_{ij} = x_{ij} - \langle x_{ij} \rangle \rightarrow \min_{\{M_i\}, \{X_j\}} \sum_{i,j} \|x'_{ij} - (M_i X_j)\|^2$$

Factorize data

Factorization of data

$$\min_{\{M_i\}, \{X_j\}} \sum_{i,j} \|\mathbf{x}'_{ij} - (M_i X_j)\|^2$$

$$\mathbf{M}_{2m \times 3} = \begin{bmatrix} M_1 \\ M_2 \\ \vdots \\ M_m \end{bmatrix}$$

$$\mathbf{W}_{2m \times n} = \begin{bmatrix} \mathbf{x}_{11} & \mathbf{x}_{12} & \cdots & \mathbf{x}_{1n} \\ \mathbf{x}_{21} & \mathbf{x}_{22} & \cdots & \mathbf{x}_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ \mathbf{x}_{m1} & \mathbf{x}_{m2} & \cdots & \mathbf{x}_{mn} \end{bmatrix}$$

$$\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_n$$

$$D = \begin{bmatrix} \sigma_1 & 0 & \cdots & 0 \\ 0 & \sigma_2 & \cdots & 0 \\ \vdots & \vdots & \vdots & 0 \\ 0 & 0 & \cdots & \sigma_n \end{bmatrix}$$

$$\mathbf{X}_{3 \times n} = [\mathbf{X}_1 \quad \mathbf{X}_2 \quad \cdots \quad \mathbf{X}_n]$$

Factorize

$$\mathbf{W} = \mathbf{M}\mathbf{X}$$

$$\mathbf{W} = \mathbf{U}_{2m \times n} \mathbf{D}_{n \times n} \mathbf{V}_{n \times n}^T$$

SVD

$$[\mathbf{u}_1 \quad \mathbf{u}_2 \quad \cdots \quad \mathbf{u}_n]$$

$$\hat{\mathbf{M}} = [\sigma_1 \mathbf{u}_1 \quad \sigma_2 \mathbf{u}_2 \quad \sigma_3 \mathbf{u}_3]$$

$$\begin{bmatrix} v_1^T \\ v_2^T \\ \vdots \\ v_n^T \end{bmatrix}$$

Estimates

$$\hat{\mathbf{X}} = \begin{bmatrix} v_1^T \\ v_2^T \\ \vdots \\ v_n^T \end{bmatrix}$$

Affine ambiguity and Euclidean upgrade

Any 3x3 non-singular matrix.

$$W = MX \rightarrow W = M \underbrace{Q}_{\text{Affine camera matrices}} \underbrace{Q^{-1}X}_{\text{3D points}}$$

$$\text{Let } M_i = \begin{bmatrix} [\mathbf{a}_{i1}]_{1 \times 3}^T \\ [\mathbf{a}_{i2}]_{1 \times 3}^T \end{bmatrix} \rightarrow M_i Q = \begin{bmatrix} \mathbf{a}_{i1}^T Q \\ \mathbf{a}_{i2}^T Q \end{bmatrix}$$

For every i th ($i=1,2,..m$) camera, orthographic constraints:

$$\mathbf{a}_{i1}^T Q Q^T \mathbf{a}_{i2} = 0$$

$$\mathbf{a}_{i1}^T Q Q^T \mathbf{a}_{i1} = 1$$

$$\mathbf{a}_{i2}^T Q Q^T \mathbf{a}_{i2} = 1$$

- Solve for $S=QQ^T$ using LSE.
- Get Q using Cholesky's decomposition.
- Q is obtained upto arbitrary rotation.

Projective factorization

Projective depth factor

$$\mathbf{x}_{ij} \equiv P_i \mathbf{X}_j \quad \Rightarrow \quad \lambda_{ij} \mathbf{x}_{ij} = P_i \mathbf{X}_j$$

$$\mathbf{W}_{2m \times n} = \begin{bmatrix} \lambda_{11} \mathbf{x}_{11} & \lambda_{12} \mathbf{x}_{12} & \cdots & \lambda_{1n} \mathbf{x}_{1n} \\ \lambda_{21} \mathbf{x}_{21} & \lambda_{22} \mathbf{x}_{22} & \cdots & \lambda_{2n} \mathbf{x}_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ \lambda_{m1} \mathbf{x}_{m1} & \lambda_{m2} \mathbf{x}_{m2} & \cdots & \lambda_{mn} \mathbf{x}_{mn} \end{bmatrix}$$

$$\mathbf{P}_{3m \times 4} = \begin{bmatrix} P_1 \\ P_2 \\ \vdots \\ P_m \end{bmatrix}$$

$$\mathbf{X}_{4 \times n} = [\mathbf{X}_1 \quad \mathbf{X}_2 \quad \cdots \quad \mathbf{X}_n]$$

$$\mathbf{W} = \mathbf{P} \mathbf{X}$$

Iterative factorization starting
With a set of initial depth factors.

The Algorithm

$$W_{2m \times n} = \begin{bmatrix} \lambda_{11}x_{11} & \lambda_{12}x_{12} & \cdots & \lambda_{1n}x_{1n} \\ \lambda_{21}x_{21} & \lambda_{22}x_{22} & \cdots & \lambda_{2n}x_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ \lambda_{m1}x_{m1} & \lambda_{m2}x_{m2} & \cdots & \lambda_{mn}x_{mn} \end{bmatrix} \quad P_{3m \times 4} = \begin{bmatrix} P_1 \\ P_2 \\ \vdots \\ P_m \end{bmatrix}$$

$$X_{4 \times n} = [X_1 \quad X_2 \quad \cdots \quad X_n]$$

$$W = PX$$

1. Choose initial values of λ s.
 2. Solve for P and X using SVD method as before.
 3. Recompute λ s.
 4. Iterate till it converges.
- Normalize data before processing, and apply inverse transformation after getting the result.
 - Normalize columns and rows of λ to make them unit norm.

Euclidean rectification

$$W = PX \rightarrow W = \underbrace{PQ}_{\text{Camera matrices}} \underbrace{Q^{-1}X}_{\substack{\text{Any 4x4 non-singular matrix} \\ \text{3D points in} \\ \text{homogeneous} \\ \text{coordinates}}}$$

$$\text{Let } Q = [[Q_3]_{4 \times 3} \quad [q_4]_{4 \times 1}]$$

$$P_i = \begin{bmatrix} p_{i1}^T \\ p_{i2}^T \\ p_{i3}^T \end{bmatrix} \quad P_i Q = \begin{bmatrix} p_{i1}^T Q_3 & p_{i1}^T q_4 \\ p_{i2}^T Q_3 & p_{i2}^T q_4 \\ p_{i3}^T Q_3 & p_{i3}^T q_4 \end{bmatrix}$$

$$\begin{aligned} p_{i1}^T Q_3 Q_3^T p_{i2} &= 0 \\ p_{i1}^T Q_3 Q_3^T p_{i3} &= 0 \\ p_{i3}^T Q_3 Q_3^T p_{i2} &= 0 \\ p_{i1}^T Q_3 Q_3^T p_{i1} &= p_{i2}^T Q_3 Q_3^T p_{i2} \end{aligned}$$

Solve for Q .

Needs to be orthogonal.

Solve for Q_3 and q_4

$$p_{i1}^T Q_3 Q_3^T p_{i2} = 0$$

$$p_{i1}^T Q_3 Q_3^T p_{i3} = 0$$

$$p_{i3}^T Q_3 Q_3^T p_{i2} = 0$$

$$p_{i1}^T Q_3 Q_3^T p_{i1} = p_{i2}^T Q_3 Q_3^T p_{i2} = p_{i3}^T Q_3 Q_3^T p_{i3}$$

$$A = Q_3 Q_3^T$$

$$Q_3 = U\sqrt{D}$$

Solve for A .

$$A = UDV^T \leftarrow \text{SVD}$$

q_4 can be determined by (arbitrarily) picking the origin of the frame attached to the 1st camera as the origin of the world coordinates.

Thank you!

Computing vanishing line

- Identify groups of sets of parallel lines in a plane at different directions.
- Obtain their vanishing points.
- Get the line among them.
